1. Instructions for use and conditions for operation of a platform car superstructure with fixed roof and side folding

1 1. Superstructure description

The platform car superstructure is designed for road traffic vehicles. Its construction and use shall follow the applicable regulations, particularly Act no. 56/2001 Coll. on conditions of operation of vehicles on roads, and Decree no. 341/2014 Coll. of approving of technical capability and technical conditions of operation of vehicles on roads. It can only be operated by persons knowing these regulations and instructed properly about operation of a platform car superstructure.

Platform car superstructures are designed particularly for transport of piece loads, above all piece load, on the platform car loading area. The load shall be laid out on the loading area evenly to prevent overloading of any part of the loading area, and secured so that it cannot be displaced or overturned during its transport. Therefore the superstructure is equipped with anchoring lugs in the aluminium frame of the platform car for fixing of the load. The load is fixed to these anchoring lugs by clamping straps. Location and number of the anchoring lugs is determined by the superstructure manufacturer, based on the applicable regulations.

Attention!

Weight of the load shall not exceed the permitted loading specified in the vehicle technical certificate. Driving with non-anchored load may cause damage to the superstructure.

The superstructure is equipped with tiltable sidewalls and tiltable rear face to facilitate loading and unloading. The sidewalls are fixed to the corner or central columns by closures. A check of proper closing of the sidewalls and rear face shall always be made before the journey, to prevent any spontaneous opening of the sidewalls during the journey.

Attention!

Drive with sidewalls or rear face tilted down is forbidden. In case it is necessary to drive with sidewalls or rear face tilted down, it is possible if these are open and slid out of their hinges.

In case of incorrect use of the structure the supplier of parts for platform car superstructures cannot be responsible for any possible damages caused by non-observance of the applicable regulations.

Any warranty for this superstructure becomes void in case of incorrect use of the platform car superstructure.

2 2. Maintenance of the platform car superstructure

The platform car superstructure does not require any special maintenance. It is important to keep the superstructure clean, wash it by pressure water, particularly during winter season, when chemicals are used on roads and that may impair functionality of the sidewall hinges and locks and cause corrosion of the galvanised components if these are left dirty for a long time.

Attention!

Hinges of the sidewalls and their closures shall be treated regularly using preservative lubricants. Closures of the central columns shall be treated regularly using preservative lubricants.

Attention!

Due to the fact that all bolted joints of the aluminium platform (clamps PALCOM) are secured by an adhesive against any spontaneous release of the bolts, it is forbidden to retighten these joints during operation. This might cause release of these joints leading to damage of the supporting parts of the superstructure.

In case of a fault on the supporting parts contact please an authorised service centre or a company that assembled the platform car superstructure. The particular company can repair the superstructure professionally using properly specified spare parts.

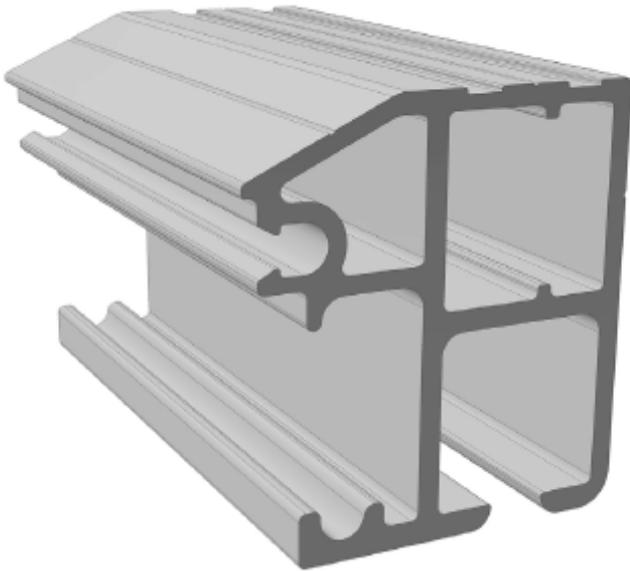

Maintenance of the platform car superstructure

The platform car superstructure consists of a set of components prepared always for the given dimension and design, according to the customer's requirement. The aluminium platform consists of auxiliary profiles, crosspieces and frame profiles connected together by special clamps. The frame profiles are connected in corners and possibly also under central column using special corner and central elements. Such assembled platform forms the platform car structure. This structure consists of corner and central columns that are also supporting components of the roof structure. Sidewalls of aluminium profiles thick 25mm with closures are fixed to the frame using hinges that enable tilting of the sidewalls and face down and their detachment. The sidewalls and rear face are manufactured mostly of one-piece profiles 400mm high. Upon customer's requirements, we can also deliver sidewalls with different heights, e.g. 500 or 600mm. The front face can be delivered with different heights, according to the customer's requirement. All profiles 100x25mm as supports of the canvas are used on sides of the superstructure, between the columns.

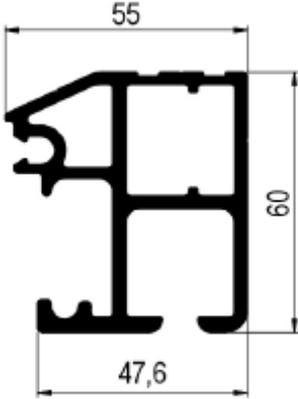

The number of profiles can be chosen by the customer.

The roof structure consists of a frame assembled of aluminium profiles 60x30x2mm, fixed to aluminium corner columns using corner assembly sets. Steel brackets with rubber inserts are riveted to this frame; aluminium tubes \varnothing 35mm for supporting of the roof canvas are located in these brackets. The canvas is not included in delivery of the company TRANS-TECHNIK.

2. GUIDE PROFILE FIXO-S

Weight: 2.22 kg/m

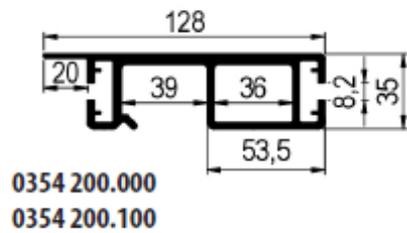

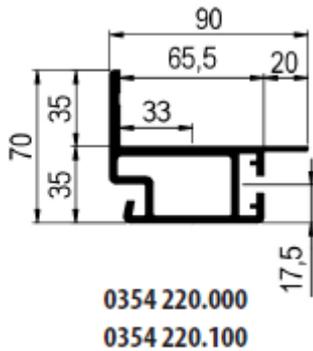

TT-no.	Sketch	Produced lengths of the guide profile
0537 021.050	 <p>A 2D technical sketch of the profile's cross-section. The sketch shows the profile's outline with three dimension lines: a horizontal line at the top indicating a width of 55, a vertical line on the right indicating a height of 60, and a horizontal line at the bottom indicating a width of 47,6. The profile has a complex shape with a top flange, a central vertical divider, and a bottom flange with a serrated edge.</p>	L = 5.0 m

Warranty and spare parts

Our parts are covered with a 24-month warranty according to the law, i.e. from the delivery date. The warranty covers any faults and failures of our parts and structures. The warranty relates to replacement of parts considered as faulty. The warranty is rejected in case when the purchaser or any third party modifies or repairs the delivered goods without prior consent of our company or in case of improper use or bad maintenance

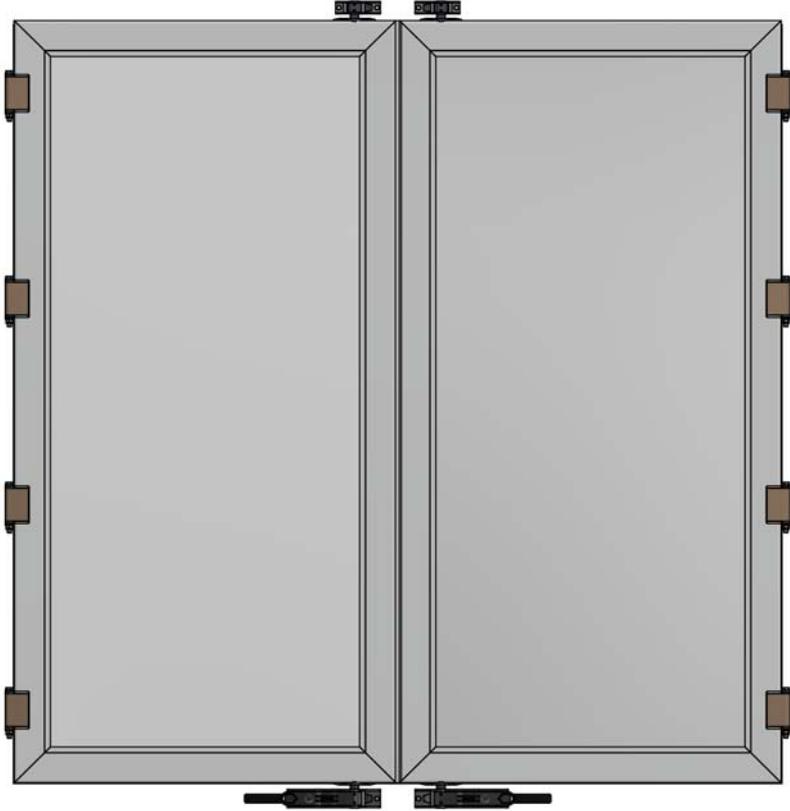

We recommend to use canvas with specific weight at least 900 g/m² for our superstructures.

Note

The manufacturer reserves the right to make changes in the technical documentation and in the structure or accessories of Versus Omega. These parts were tested in view of their safety and functionality. Versus Omega is not responsible for any damage or injury caused by use of non-original spare parts and accessories.

Delivery and handover of spare parts and accessories provides:
TRANS-TECHNIK spol. s r.o., Tyršova 1146, 664 42 Modřice

Manual for ordering, installation and use of TT gate

Division of gates, designs and basic dimensions for ordering of gates.

Rear gate can be in the following designs: - double-leaf - double-closure - four-closure
 - four-leaf

- the closures are outer or with flushed closures upon request.
 - gate material: Al natural - Al anodized - Al varnished - Al frame + panel.

Rear gate made of Al profiles with sealing along perimeter and rubber sealing across the centre.

Surface natural and varnished - gate profiles and panels are welded in corners on both sides + Al panels welded from inside (at the top, in the centre and at the bottom).

Designs with anodized surfaces and panels - gate welded in corners from inside. The design with anodized surfaces - the filling panels are welded from inside (at the top, in the centre and at the bottom). The gate panels are glued in the frame profile from outside.

The hinges are made of steel, standardly screwed; also available with welding on or Al riveting (natural or anodized) hinges.

This gate design guarantees high strength, stiffness and therefore long lifespan.

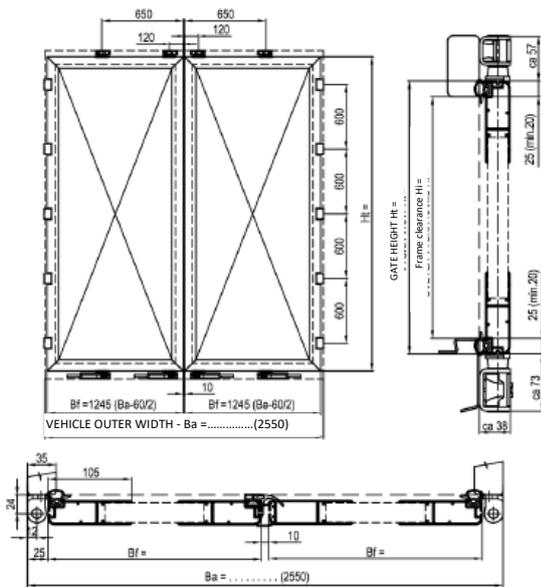

Dimensions for ordering of gates:

When ordering gates, specify dimensions: **Ba x Ht (mm) = (Vehicle outer width x gate height).**

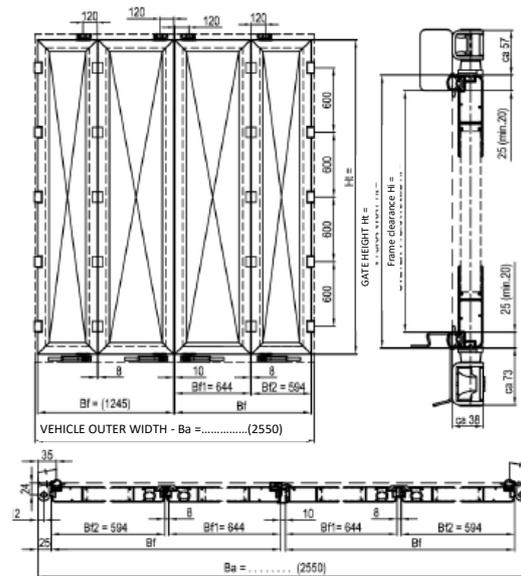

Recommended overlap of the frame and upper portal = 25mm (min. 20mm), see the picture below.

Warning: The gate is provided with a label in its lower corner for easy identification.

**Double-leaf gate
 basic dimensions**

**Four-leaf gate
 basic dimensions**

VEHICLE OUTER WIDTH - Ba =	VNĚJŠÍ ŠÍŘKA VOZIDLA – Ba =
GATE HEIGHT Ht =	VÝŠKA VRAT Ht =
Frame clearance Hi =	SVĚTLÁ VÝŠKA RÁMU Hi =

Gate installation - main principles:

Thickness of the column for installation of a gate min. 35mm (due to function of the sealing).

1. Spacing of the hinges is 600mm. Gate shall be located so that the upper and lower overlap of the frame (portal) is min. 20mm, recommended 25mm.

The hinges (welded on, screwed) shall be located so the hinge outer edge is aligned with the outer edge of the column. The hinge "recess" should face to the superstructure outer dimension. See the picture.

Screwed closure: each hinge is fixed using two M8 bolts, strength 8.8.

Welded on hinges: the weld shall be located in the "recessed" part of the hinge, on its outer side (at the bend).

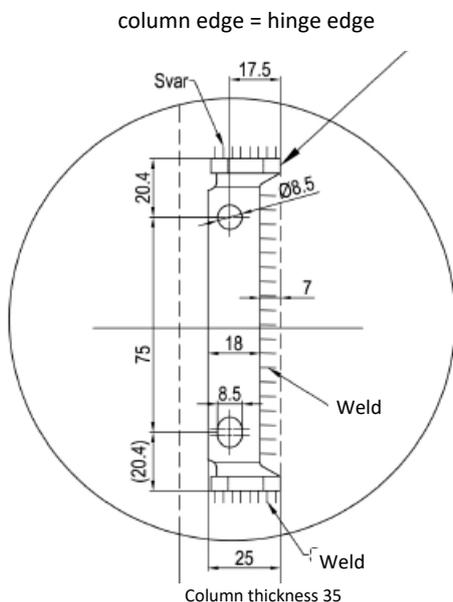

Riveted hinge should be fixed over the column corner by rivets dia. 6,4 x length (acc. to the column wall thickness).

The way of riveting: 1 rivet in the hinge centre, 1 rivet above and under the hinge; applies for each hinge.

ATTENTION!! In case of steel (screwed and welding on) hinges do not tighten the screw M12x140. Tightening - lamping - of the gate joint causes bad causes bad function of the hinge and may lead to sweeping and damage to the sealing.

2. Check the so-called pusher for its damage or knocking off after installation or due to improper use; this component has to protect sealing against sweeping, so sealing of the gate against water in the loading area. The pusher can be installed or replaced easily in case of its loss or damage.

3. We recommend to install a drip mould over each gate to prevent flowing of water from the roof onto the gate.

VEHICLE OUTER WIDTH Ba

Use of gates

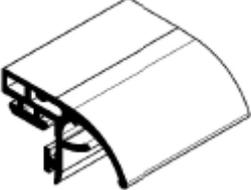

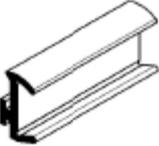

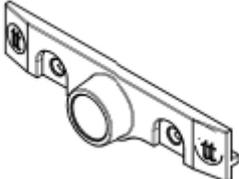

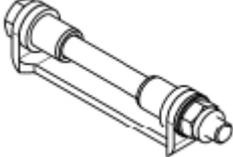

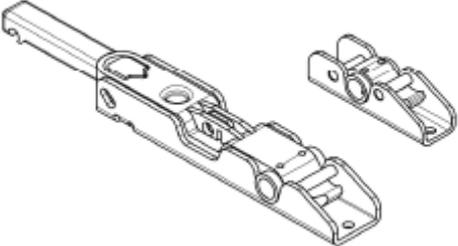

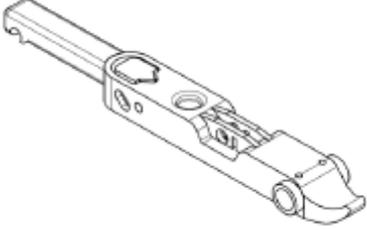

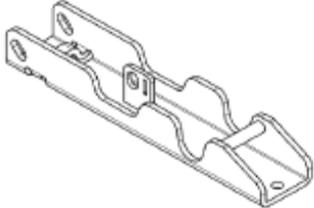

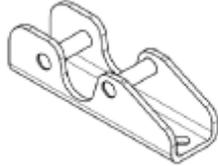

1. **!!! The gate shall be braced diagonally during operation - the journey. !!!!**

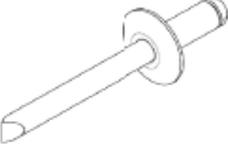

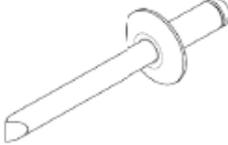

2. **The gate shall be secured i open position using the gate bracket.**
 - do not drive with open gate.
 - . before the journey check whether the upper and lower closures are in closed positions.
 - secure the load against any displacement. The load shall not be in contact with the gate.
 - . Check presence of the gate pusher (located at the gate bottom corner).

Basic spare parts for gates

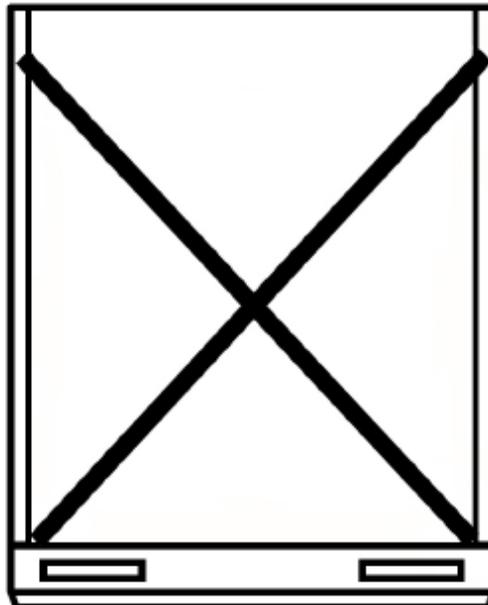

TT-no.	Description	Sketch
0512 026.000	Peripheral sealing	
0512 027.000	Central sealing 2K	
0512 028.000	Central sealing 4K	
0512 032.100	Pusher
